MGC-FINTECH Project Summary

I worked on developing **MGC-FINTECH**, a full-stack financial and business management web application.

FRONTEND DEVELOPMENT

On the frontend, I worked with React, TypeScript, HTML, and CSS to build the user interface, dashboards, business modules, and responsive layouts.

BACKEND INFRASTRUCTURE

On the backend, I used Supabase and PostgreSQL, with SQL and PL/pgSQL for database management and business operations. I also implemented user authentication and Row Level Security to protect users' data.

SYSTEM INTEGRATION

I integrated the frontend with the backend so that customer registration, sales, invoices, payments, inventory updates, and financial transactions could work together seamlessly.

DEVELOPMENT & DEPLOYMENT TOOLS

For development and deployment, I utilized Node.js, npm, Git, GitHub, and Netlify.

KEY SKILLS GAINED

The project helped me gain practical experience in:

- Full-stack web application development
- Relational database design and optimization
- Robust API integration and data synchronization
- Backend security configuration and data protection
- Comprehensive testing, debugging, and troubleshooting
- Automated cloud deployment pipelines
